

Product Review App

This app is meant for a consumer to be able to scan the barcode of a product that they may be using at home, and write a review for it / rate it. Thus, if another person would like to read reviews of that product, they can scan the barcode of a product at a store and read the reviews of it. A person should be able to put the price point at which they bought the product into the review of the application. Each person should have a login, thus identifying who is reviewing a product; thus blocking out spammers.

Features:

There are two main features of the app. The first is to scan a barcode then review the product and pull up current prices at different stores. The second is to scan a barcode and read the reviews of the product. These can be separated by two buttons after you scan the barcode of a product. When a product is scanned, a picture of the product will show up along with its name and two buttons underneath it. One button for writing a review and the other for reading reviews. The write button will take you to a page with a text box for your review and another box for the price you paid for it. Underneath those will be the submit button. After clicking submit you will be taken back to the home page. When you click on the read button a scroll menu of all the reviews for this particular product will show up. Each review will have a rating based on their helpfulness, rated by other readers. The current reader can also rate the review with like/dislike buttons on the right side. This page will also have a back button that will take you back to the home page.
